

Electronic Vibration Switch (EVS)

Also available, optional internal battery powered EVS switch model, designed for use on ignition powered systems.

Features

- Piezoelectric-crystal internal sensor with built-in microelectronics for reduced noise sensitivity
- Electronically integrated output signal that measures and trips on velocity
- Adjustable calibrated set-point controls
- Shutdown set-point measured in velocity
- Optional 4-20 mA output for continuous monitoring capability
- Solid-state outputs for setpoint trip
- Adjustable time delay to prevent false tripping on high-vibration start-ups or non-repetitive transient events
- Self-test and calibration

The **Electronic Vibration Switch (EVS)** protects against equipment failure by monitoring velocity-based vibration levels and providing an early warning or shutdown when abnormal vibration is detected.

The EVS product can be connected to Murphy's TTD™ annunciator, Centurion™ or Millennium™ controllers for increased functionality. It also complements Murphy's VS2™ shock and excessive vibration/pulsation switch, which is designed to detect an abnormal shock or pulsation due to equipment failure and to shutdown other equipment in a system to prevent further damage.

The EVS product can be used on any equipment where abnormal vibration could lead to equipment damage, including:

- Cooling fans
- Engines
- Pumps
- Compressors
- Gear boxes
- Motors
- Generator sets

The EVS product can monitor and alert the operator of abnormal vibration caused by a variety of possible factors, including:

- Imbalance and misalignments
- Defective sleeve bearings
- Broken tie down bolts
- Defective ball or roller bearings
- Gear mesh
- Blade pass frequencies
- Detonation
- Broken parts
